in everyday life we identify faces regularly and seemingly with great ease one might assume this to be a straightforward and highly

accurate task however we are poor at identifying the faces of unfamiliar people who we have never met before despite the fact that many important everyday tasks depend on this forensic face matching requires the comparison of two face photographs of a person who is not known to the observer this seemingly simple task is critical for a wide range of security tasks such as person identification at airports and borders passport issuance and renewal and criminal identification in police investigations despite its ubiquity face matching is highly prone to error even under conditions that are designed to maximally facilitate this task for this reason face matching has been studied extensively in psychology with the bulk of the research conducted since 2010 forensic face matching provides readers with a wide ranging detailed and critical overview of facial comparison and face matching providing insights into its application efficacy and limitations in occupational settings and of current scientific knowledge of this task

the concept of algorithms what are the algorithms and why do you have to learn them before you learn any programming language the algorithms are called algorithms in english the first thing you should know is that the algorithm is not a programming language it is methods of analysis and thinking that we have to follow so you can write the code properly what's the problem with everyone being afraid of programming

abstract although neural networks have been used to develop highly accurate classifiers in numerous real world problem domains the models they learn are notoriously difficult to understand this thesis investigates the task of extracting comprehensible models from trained neural networks thereby alleviating this limitation the primary contribution of the thesis is an algorithm that overcomes the significant limitations of previous methods by taking a novel approach to the task of extracting comprehensible models from trained networks this algorithm called trepan views the task as an inductive learning problem given a trained network or any other learned model trepan uses queries to induce a decision tree that approximates the function represented by the model unlike previous work in this area trepan is broadly applicable as well as scalable to large networks and problems with high dimensional input spaces the thesis presents experiments that evaluate trepan by applying it to individual networks and to ensembles of neural networks trained in classification regression and reinforcement learning domains these experiments demonstrate that trepan is able to extract decision trees that are comprehensible yet maintain high levels of fidelity to their respective networks in problem domains in which neural networks provide superior predictive accuracy to conventional decision tree algorithms the trees extracted by trepan also exhibit superior accuracy but are comparable in terms of complexity to the trees learned directly from the training data a secondary contribution of this thesis is an algorithm called bbp that constructively induces simple neural networks the motivation underlying this algorithm is similar to that for trepan to learn comprehensible models in problem domains in which neural networks have an especially appropriate inductive bias the bbp algorithm which is based on a hypothesis boosting method learns perceptrons that have relatively few connections this algorithm provides an appealing combination of strengths it provides learnability guarantees for a fairly natural class of target functions it provides good predictive accuracy in a variety of problem domains and it constructs syntactically simple models thereby facilitating human comprehension of what it has learned these algorithms provide mechanisms for improving the understanding of what a trained neural network has learned
